Assignment - 1

Title: Create a github profile, fork an existing repository, clone the forked repository to the local system, push updated contents in local github repository.

Objectives: To understand version control system (VCS) by creating a github it to the local system, updating it's system contents and pushing the changes back to github.

Introduction:

Github is a platform to store, manage and collaborate on software projects using git, a distributed version control system. Git keep track of changes made to files and allows developers to maintain different versions of project.

In this assignment the basic Github workflow of forking cloning, modifying commiting and publish a repository was performed.

M.M.I.T

Page No: Date:

Procedure

1. Create a Github Profile.

- A github account was created by registering on github website.

2. Forking an existing repository

- An existing repository was download to the local computer using the following command.

git clone <repository URL>

- The repository folder was then opened using cd <repository-name>

3. update the local repository

- The files in the cloned repository was modified by adding or updating the required content. The changes were checked using.

git Status

- The updated files were added to staging area using

git add .

v) Commit the changes

- The changes were saved in the local git history using.

```
git . commit -m "update repository content"
```

- A commit records changes made to the repository along with a message describing the update.

vi) Push the changes to Github

- The commited changes were updated/ uploaded to the forked repository using

```
git push origin main
```

- The updated contents were then visible in the github repository.

Result:

The github ~~project~~ profile was created successfully An existing repository was forked, cloned to the local system, updated commited and pushed back to github successfully.
